Flynn M, Austin N, Flynn TS, Ford R, and Buckland L: Universal Newborn Hearing Screening introduced to NICU infants in Canterbury Province, New Zealand. The New Zealand Medical Journal. 2004: 117(1206).	<p>UNHS* was conducted for NICU* infants over a 12-month period. The purpose was to assess the feasibility of introducing UNHS over the 12-month period.</p> <p>If a baby failed initial screening, a rescreening was conducted before the baby was discharged. Testing was conducted once the baby was 34 weeks GA* and older than 48 hours.</p>	Parents of all babies admitted from mid-July 2001 through mid-July 2003 to the NICU at Christchurch Women's Hospital were offered the opportunity to have their baby's hearing screened using the GSI-70 otoacoustic screener.	Infants who were admitted to the NICU and remained there at least 48 hours.	435 (64%) of 688 NICU infants born at Christchurch Women's Hospital were eligible by meeting the 48-hour stay required.	<p>2 of 435 (4.6/1,000) babies had moderate-to-severe bilateral sensorineural hearing loss.</p> <p>Only one of the babies had risk factors for hearing loss.</p>	<p>UNHS was cost-effective and implemented efficiently and cost-effectively within the neonatal services of a New Zealand hospital. The study shows the benefits of UNHS against "at-risk" screening</p> <p>27.1% of the babies screened had one or more risk factors.</p> <p>The positive predictive value of UNHS (10.53%) was significantly greater than that of "at-risk" (0.85%) screening.</p>
